Minimum Annual Wage Requirement
\$591 x 52 x 110% = \$33,805.20

While Oldham County's population has been slowly increasing, when compared to the state as a whole, its per capita income has fluctuated over the years. Oldham County's per capita personal income, \$22,878, is now 74.4 percent of the Texas average, falling from a high of 123.7 percent in 1991. This trend will continue because Oldham County's economic base remains heavily tied to the natural resource sector.

Wages paid to area workers are also lagging state levels. Over the last 15 years, Oldham County's workers earned about 35 percent less than the state average. In 2005, a full-time employee earned \$25,346 or 46.0 percent more than a decade ago. Since 1990, however, the County's wage growth rate has fluctuated relative to the state as a whole. Full-time wages are now just 66.8 percent of the Texas average, falling from 74.0 percent in 1990.

Board Finding Number 3.

Average salary levels of qualifying jobs are expected to be \$35,000, which is more than 110% the current Oldham County average salary of per manufacturing job as determined by the Texas Workforce Commission.

Board Finding Number 4.

The level of the applicant's total investment per qualifying job over the term of the Agreement is estimated to be approximately \$6.1 million for the entire Oldham County project.

While this finding is included largely as an item of information, it is indicative of Wildorado Wind's planned capital investment in Vega ISD. This is the type of investment that is the foundation for improved economic activity in the Vega area.

The benefits of Wildorado Wind to the Vega I.S.D. and the Oldham County economy consist of the day-to-day operation of the energy project, normal operating expenditures, purchases from local vendors, and spending of people employed by these businesses. The economic benefits of this economic activity materialize in the form of increased Oldham County employment and income.

For this study, TXP has calculated the economic impact of business activity of Wildorado Wind based on annual investment and employment levels. The economic assumptions underlying the analysis are summarized in Section 3. Specifically, this analysis measures the anticipated economic impacts of Wildorado Wind's wind energy project using the IMPLAN input-output economic system, RIMS II, and the Job and Economic Development Impact model (JEDI). TXP has customized the models by modifying the underlining industry data and by altering regional purchasing coefficient assumptions.

In an input-output analysis of new economic activity, it is useful to distinguish three types of expenditure effects: direct, indirect, and induced. Direct effects are production changes associated with the immediate effects or final demand changes. The payment made by an out-of-town visitor to a hotel operator is an example of a direct effect, as would be the taxi fare that visitor paid to be transported into town from the airport.

Indirect effects are production changes in backward-linked industries caused by the changing input needs of directly affected industries – typically, additional purchases to produce additional output. Satisfying the demand for an overnight stay will require the hotel operator to purchase additional cleaning supplies and services, for example, and the taxi driver will have to replace the gasoline consumed during the trip from the airport.
